

AI AGENT TEAMS

Your agents never get better

2025

In a 2025 conversation Karpathy named the missing piece: during sleep humans distill the day's context into the weights of the brain. Today's models have no equivalent.

THE PROBLEM

A brilliant intern with amnesia

A stateless agent starts from zero every session. A teammate who reviewed your payments module last month carries that context into this month — the agent re-derives it, badly, every time. Codebases move every day; the instructions rarely do.

THE NIGHT SHIFT

The agent proposes, a human disposes

Every agent's output is a plain file in the repository, and self-modification is a proposal.

THE SELF-STUDY LOOP

What the agent does at night

The cycle is deliberately small and bounded: the goal is a finished note every night, not a perfect map of the repository. A short, accurate note beats a long investigation that never finishes.

Re-read the role	the anchor
Sample the code	a strict budget
Write a learning note	what I learned today
Detect drift	record, do not fix
Propose an evolution	a human decides

GUARDRAILS

Why you can leave it running

The discipline is borrowed wholesale from operations. Nothing runs forever and every run ends in a known state — the boring operational layer that turns a pile of scripts into something you can actually leave running.

Rotation	none is starved
Concurrency limits	predictable cost
Watchdog	too long a silence ends the run
Reconciliation	the books balance

MICODE

We will build your night shift

We run this approach in production: a schedule, a rotation, bounded runs and an artifact for every run — with a human at the gate. We start with one agent, one note and one habit.
