

AN AI AGENT FOR POLISH ACCOUNTING

One agent, up to 82 tools

82

That is what our accounting agent has at hand: 58 available to everyone, plus 15 for HR and payroll and 9 for KSeF once those capabilities are configured. We built it in-house — and the same pattern carries over to a client's systems.

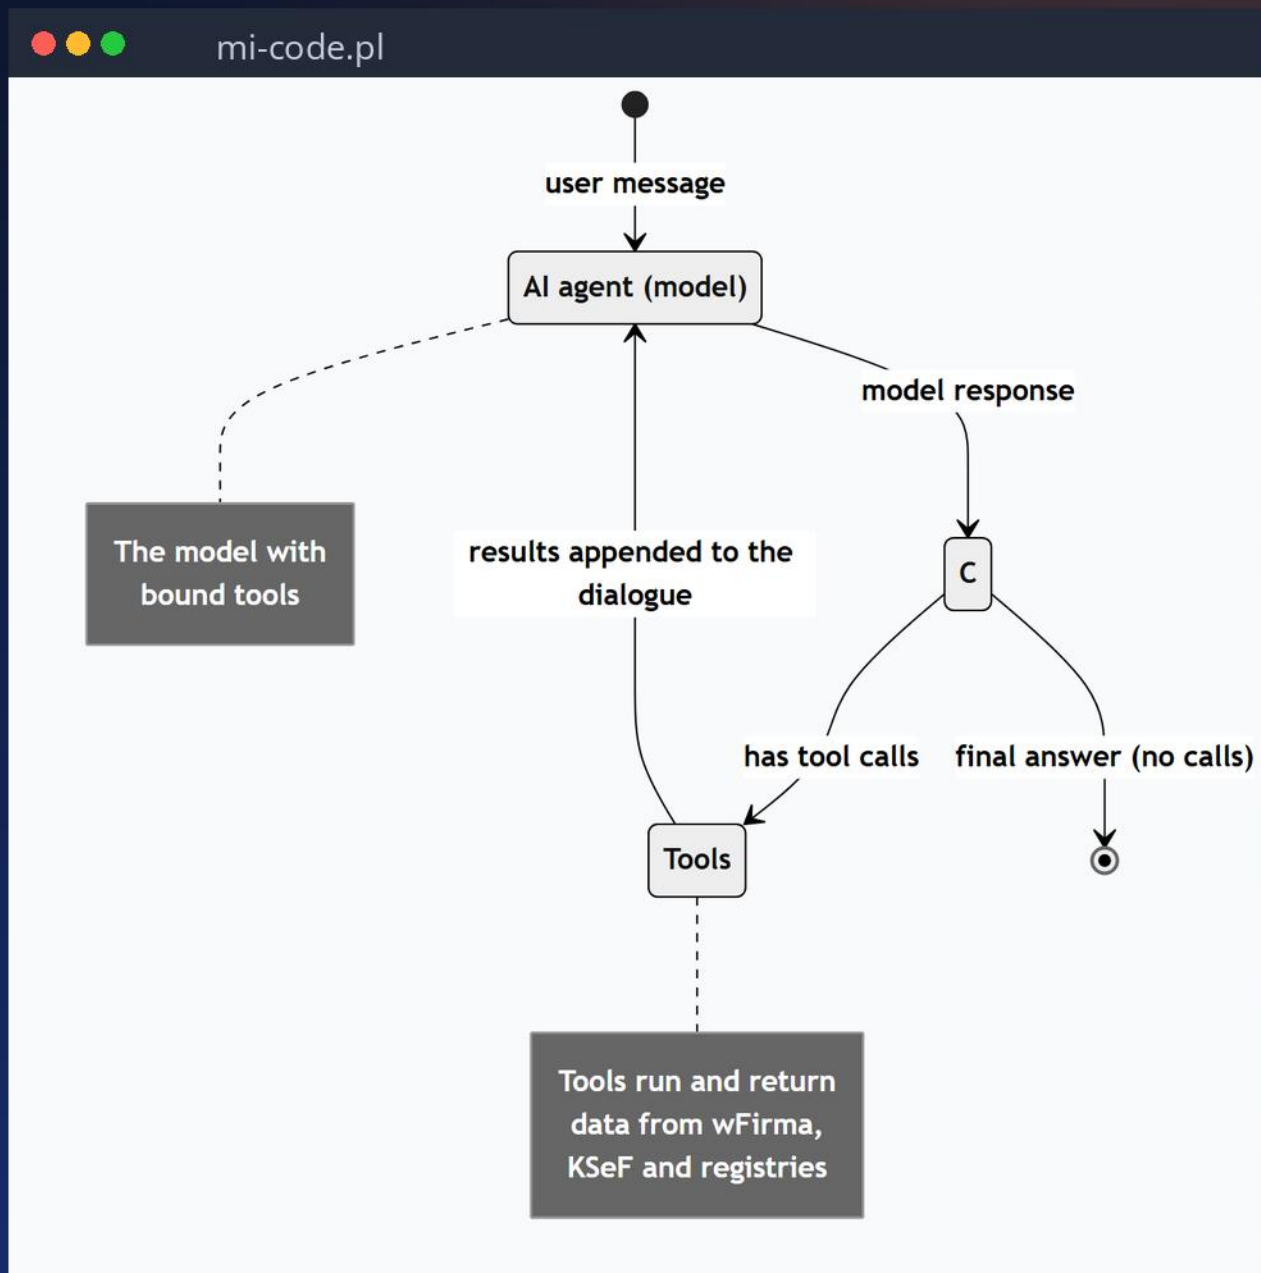

THE PROBLEM

A confident chatbot is expensive

A generic model will name a deadline that does not exist, invent an account number or “recall” last year's rate — and all of it sounds convincing. In Polish accounting the price of that mistake is measured in real money and penalties.

ARCHITECTURE

One agent, not a swarm

TOOLS

The model decides, the code executes

A tool is a specific ability: get the list of invoices, create a contractor, calculate payroll, send an invoice to KSeF. The model only picks which one to call — vetted code runs it.

Available to every user	58
HR and payroll, once configured	+15
KSeF, once configured	+9
Hard step cap per request	25

DATA INSTEAD OF GUESSWORK

It checks the source, it does not guess

Answers are built on your invoices in wFirma, on the Polish public registries and on the official tax-deadline calendar. For any payment of 15,000 zł or more, the law requires a “White List” check on the contractor's account — the agent runs it unprompted.

Invoices and payments	wFirma
Contractor from a NIP	Biała Lista, KRS
Legal basis for the check	Art. 117ba
Receipt from a photo	GPT-4o

MICODE

We will build one inside your systems

The same pattern — one agent, vetted tools, answers from your data rather than off the top of the head — carries over to your processes and your integrations. We start with a conversation about what is genuinely worth handing to an agent, and what is better left to a person.
