

WE BUILT THIS IN-HOUSE

Your knowledge base, your server

60

At most that many days pass before every claim in the “norm” layer goes back for a re-check. And since every model swaps for a local one, no user question has to leave your own hardware.

THE PROBLEM

Out of date sounds just as confident

An internal base ages quietly: the procedure changes, the document stays the same. An assistant built on that base answers as fluently as ever — only from last year's state of affairs. The model itself will not notice.

THE KNOWLEDGE BASE IS THE PRODUCT

Two layers we never mix

“Norm” is what the law requires: linked to its source and marked verified only after a lawyer's review.

“Practice” is an applicants' observation, always dated, with a date after which the fact counts as stale.

Norm re-checked	every 60 days
Practice expires	by +90 days
A new page	starts as a draft
Reaches users	after review

WHERE THE PRACTICE COMES FROM

A filter that would rather lose a fact

The collector turns open chats into anonymised facts, and the personal-data filter runs on a “safety first” principle. After the classifier's work was split into small batches, useful-but-misfiled facts are down to about 3%.

Through the collector	2.4 million
A fact with personal data	dropped
Misfiled facts	about 3%
Into the base	by a curator

YOUR OWN SERVER, YOUR OWN MODELS

Swap the models, keep the code

Understanding the question, composing the answer, speech in and speech out — every one of those models swaps for a local one, Ollama or LM Studio for instance, with a single setting.

Meaning and generation	a local model
Speech both ways	a local model
Switching over	a single setting
Users' questions	stay with you

MICODE

We build the base, not just the bot

We start with a conversation about what counts as “norm” and what counts as “practice” in your company, who approves it, and how long a fact stays valid. The choice of models — and whether they run on your own hardware — comes after that.
